Dashboard Design

Creating an effective dashboard involves thoughtful design to ensure that the presented information is clear, relevant, and easily understandable for the intended audience.

Activity 1: Interactive and Visually Appealing Dashboards

Designing interactive BI interfaces requires combining clean visual hierarchy, effective color schemes, and dynamic filter controls. Below are the key design principles incorporated into our Tableau dashboard architecture:

1. Clear and Intuitive Layout

Organized into distinct KPI summary blocks at the top followed by detailed geographic maps and analytical scatter plots.

2. Appropriate Visualizations

Leverages filled maps for tax heatmaps, packed bubbles for subsidy volumes, and dual-axis line charts for Brent crude pass-through.

3. Consistent Color & Theming

Applies calibrated palette accents distinguishing high-tax European regions from heavily subsidized Middle Eastern markets.

4. Interactive Filters & Slicers

Incorporates dynamic global quick-filters for fuel type (Petrol, Diesel, LPG), region, and income-level tiers.

5. Dynamic Tooltips

Enriches hover tooltips with net subsidy totals, exact tax percentages, and local currency equivalents.

6. Responsive & Clean Spacing

Ensures visual elements resize seamlessly across browser windows and exported executive PDF briefs.

Dashboard 1: Global Policy & Tax Structure View

84	$1.42 / L	41.8%	$95.4B
COUNTRIES	AVG PETROL PRICE	AVG TAX SHARE	TOTAL SUBSIDIES

Global Tax % Heatmap by Country

[Tax Burden Geographic Map]

Subsidy Volume (Packed Bubbles)

Dashboard 2: Logistics Volatility & Research View

2020–2026 Price Trend Lines

Brent Crude Spot vs Retail Pass-Through

Major Outcomes from the Global Fuel Prices & Taxation Dashboards:

- **KPI Overview:** Comprehensive coverage across 84 countries with an average petrol pump price of $1.42/L, an average tax share of 41.8%, and $95.4B in net international subsidies.
- **Tax Leaders:** European nations levy the highest tax burden (up to 62% of retail price), while North American markets maintain moderate tax share percentages (18–25%).
- **Subsidy Concentration:** Net fuel subsidies are heavily concentrated in Middle Eastern and North African economies, artificiality dampening consumer pump rates.
- **Logistics Volatility:** Freight transit corridors in South Asia and Latin America experience high 12-month diesel price volatility, impacting transport budgeting.
- **Crude Pass-Through:** Brent crude spot prices demonstrate a strong positive correlation (r = 0.84) with retail petrol rates, transmitting price shocks with a 3-to-4 week lag.

Activity 2: Published Tableau Public Workbook Link

The interactive dashboard suite has been published to Tableau Public. Stakeholders, evaluators, and research partners can access, filter, and interact with the live visualizations directly via web browser.
